# THE HUMAN EARS

The Human ears are the organs for balance and audition, i.e. sound sensing. It is an important sense organ. Those whose ears cannot hear are said to be deaf.

The ear is shaped like a funnel for taking in sound. All we see ordinarily is funnel like structure, however biologist tells us that there are more structures that aid the ear in its functions. For example, the ossicle bones in the ear are said to be the balance regulators of the body.

**Care for the Ears**

- Very noisy or too loud area should be avoided unless one has an ear guard.
- The outer ear should be cleaned at least once weekly with cotton bud or any other suitable cleaning agent.

*Ear drops are also good for the ears, however apply only once a month or as frequent as your doctor instructs you.*
