THE NOSE

The nose is the human sense organ for smelling. There are two nostrils in one's nose. The nostrils do contain hairs that help filter the air that is been inhaled. The nose is the sense organ that tells us ordinarily if the air around us or that is coming from somewhere is safe or not. However, some other poisonous gases that do not have odours could not be easily sensed.

Care for the Nose

- Avoid smelling places as the gases that constitutes such odours are not safe for you.
- Smokes and exhaust gases usually contain carbon and can suffocate one.
- The bone in the nose is very important so avoid any activity that would damage or harm that bone.
