MATERIALS

Materials is the matter from which a thing a thing is or can be made. In other words, materials are those things that we use to make a new thing.

Materials are not tools. Tools themselves are products of engineering already. They are used to join or manipulate materials into products we can use which becomes a solution to one of our problem.

There are many materials used in making new products. Examples are: wood, rubber, metal, paper/cardboard, ceramics, etc.
