VISUAL BASIC EVENT PROCEDURES

The codes in Visual Basic are organized in procedures. Each of your procedures will be sub procedure which begins with `Private Sub` and ends with `End Sub.` There are other procedures, for example the function procedure. These programs that run the sub procedure can be called Sub programmes.

Visual Basic automatically names your event procedures for you. The name is usually a combination of the object's name, an underscore (_), and the name of the event being coded. For example `cmdDisplay_Click` is the click event of the command button named `Display`.
