HTML contains several elements for defining user input and computer code. They are <kbd>, <samp>, <code>, <var>, <pre>.

HTML <kbd> Element

The HTML <kbd> element is used to define keyboard input. The content inside is displayed in the browser's default monospace font.

HTML <samp> Element

The HTML <samp> element is used to define sample output for a computer program. The content inside is displayed in the browser's default monospace font.

HTML <code> Element

The HTML <code> element is used to define a piece of computer code. The content inside is displayed in the browser's default monospace

font. The code does not preserve extra whitespace and line-breaks, thus, we put the `<code>` block inside a `<pre>` element.

HTML <var> Element

The HTML `<var>` element is used to define a variable in programming or in a mathematical expression. The content inside is typically displayed in italic.
