HTML Iframes

The HTML `<iframe>` tag specifies an inline frame. An inline frame is used to embed another document within the current HTML document.

The Syntax

```
<iframe src="url" title="description">
```

The `title` attribute is very important as it tells what the iframe content is all about.

Iframe Height and Width

You can use the height and width attributes to specify the size of the iframe. The height and width are specified in pixels by default:

For example:

```
<iframe
src="https://www.google.com/search?igu=1"
title="Google Search" width="400"
height="300">
```

Or instead, you can use the CSS height and width properties to set the size of the iframe:

For example:

```
<iframe
src="https://www.google.com/search?igu=1"
title="Google Search" style="width: 400px;
height: 300px">
```

Iframe as Target for a Link

An iframe can be used as the target frame for a link. The target attribute of the link must refer to the name of the iframe:

For example:

```
<iframe name="gl" src="#" title="Google
Search" width="400" height="300">

<p>
  <a
href="https://www.google.com/search?igu=1"
target="gl"></a>
</p>
```
